

Meos Control with GN products software

Overview

MEOS Control deployed with GN Products software enables a modern architecture where MEOS Control gets the schedule from KOGS, enables scraping of antenna system metrics to azure with grafana and more.

All components, MEOS Control, Electron, Spaceport, Cosmic and Falcon shall be deployed using centralized deployment tool AWX. This is to ensure that systems are documented and deployed according to the same template.

Operational responsibility

The operational responsibility for MEOS Control is captured in the matrix below:

RESPONSIBILITY	GN PRODUCTS	OPERATIONS	PLATFORM	KSGS
Definition	I	RA	I	R
Development	C	C	I	RA
Integration	CI	RA	I	C
Deployment	I	RA	C	I
Monitoring	I	RA	I	-
Incident Management	I	RA	I	-
Documentation	RA	C	I	-

Main purpose of software components

Architecture

MEOS Control enables control over the antenna specific components(Cortex/ACU/...)

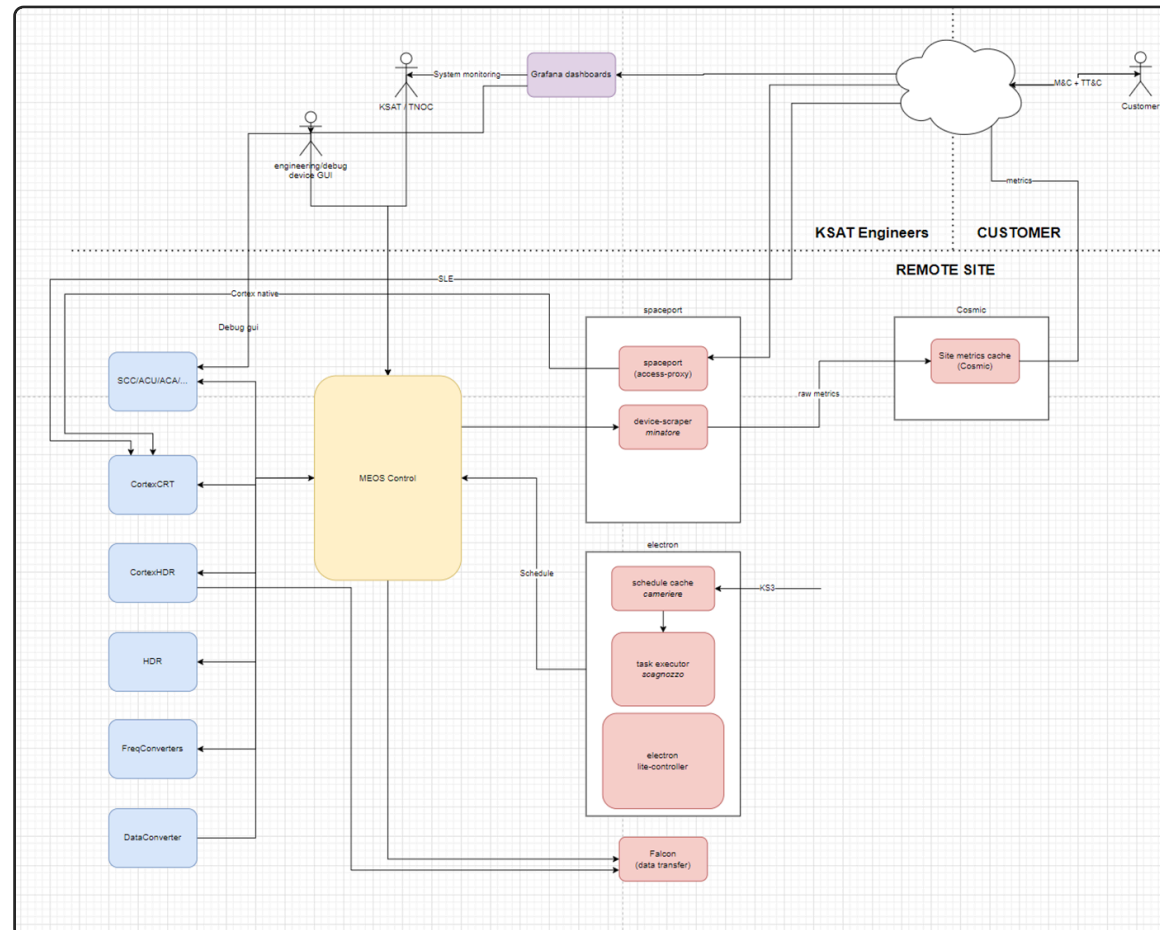

Electron(aka "lite controller") bridges the gap between KSAT APIs and MEOS Control interfaces, enabling schedule management using KS3

Spaceport enables metrics scraping of subsystems. End goal is to also use "KSAT Lite proxy" or other proxy-architecture in spaceport for Meos/Cortex

Cosmic ensures secure transportation of metrics from site to Azure. Cosmic will also be the entry-point for customers using control-API when this is ready for MEOS Control systems.

Falcon provides file transfer services from antenna system to customer AWS S3 or KSAT FTP
